

Load_Voltage and Source_Voltage by EventEnqueuedUtcTime

● Load_Voltage ● Source_Voltage

This graph used telemetry data received from IOT Hub, containing values of the voltages of source and load. (Note that these telemetry data are simulated by python, not real data). This graph clearly shows the operating voltage across the source and the load impedance.

Using this graph, one can easily determine if the circuit system is operating as expected or it needs fix without really touching the circuit.
